## M7019 Series– DC/DC Power Supply

### Functions and Signals

#### **INHIBIT** (pin 8)

Description: The **INHIBIT** signal is used to turn the power supply ON and OFF.

Operation: Applying “1” or leaving open will turn the power supply ON. For constant operation, leave this pin unconnected.

Applying “0” or shorting this pin to its return line will turn the power supply OFF.  
(Optional to change the logic of this signal. Please consult with factory.)

Signal Type: 5V TTL or dry contact (open/short).

Return line: This signal is referenced to **INPUT RTN** pin.

**Optional to change the logic of this signal. Please consult with the factory.**

#### **SENSE** (pin 2) & **SENSE RTN** (pin 3)

Description: The **SENSE** is used to compensate for voltage drop across the output wires by sensing the voltage at the load and correcting the increasing the output voltage accordingly, to provide the desired voltage at the load's terminals.

Operation: Connect the **SENSE** pin to the positive load terminal, and the **SENSE RTN** pin to the negative (return) load terminal.

The sense compensation is typically limited to 5% or 0.5V – the lesser of the two.

**Note:** If not used, connect **SENSE** directly to **OUTPUT** pins, and the **SENSE RTN** pin directly to the **OUTPUT RTN** pins.

**DO NOT LEAVE THE SENSE/SENSE RTN PINS UNCONNECTED-** the output voltage will increase by 5% to 8%.
